

## How to Fix Errors and Issues

1. Read carefully what appears in the Cascade panel (right side in Windsurf) and in the terminal

Often, you'll see important instructions or key details in these two places. Don't skip them — they usually tell you what went wrong or what's missing.

2. Use Google or ChatGPT

If you don't understand what's showing up in Cascade or the terminal, copy that message and look for answers online. Many common issues are already documented.

3. ChatGPT.com is available even if you don't have an account or subscription. Just make sure to provide enough context, like:

*"I'm using Windsurf AI to build a website, and I'm getting this error in Cascade/terminal: {error}. How can I fix it?"*

4. Follow all the steps in the course

I know the video is sped up in some parts, but all the important steps are covered. For example, if you don't install Python exactly as shown in the course, it's very unlikely that you'll be able to continue. Don't skip steps, settings, or programs.

5. Ask for clarification in the comments section

If something is unclear, please use the comments section under the lesson. Be as specific as possible — include as many details as you can. If you write something vague like *"It's not working for me"*, I won't be able to help you effectively.
