What MCPs and settings you need to configure

Add the global rules:

- Go to Windsurf Settings (very bottom right, blue bar) → Memories and Rules.

- Open the Global Rules tab.

- Paste the content from my file, then press Ctrl+S and click the refresh icon.

Install the recommended plugins:

- Go to Plugins.

- Install the following:
  - ✅ Memory
  - ✅ Sequential Thinking
  - ✅ Git (even if it throws an error, you can come back to it later)
  - ✅ Filesystem MCP (enables folder access; D drive recommended)
  - ✅ Supabase
  - ✅ GitHub (generate and add your personal access token)

If the GitHub MCP doesn't work:

- Manually open Docker.

- Wait one minute.

- Click the refresh icon in Windsurf.
